# Enabling the Response Time Monitor in SAP GUI

The Response Time Monitor is a built in feature of SAP GUI which allows the end user to see what the actual frontend response time was for a given transaction. Frontend response time is the time it takes for the transaction to make the trip from SAP GUI to the application server and back to SAP GUI. Comparing Frontend Response times to established benchmarks can assist an agency in establishing the amount of time expected to conduct certain transactions from within SAP.
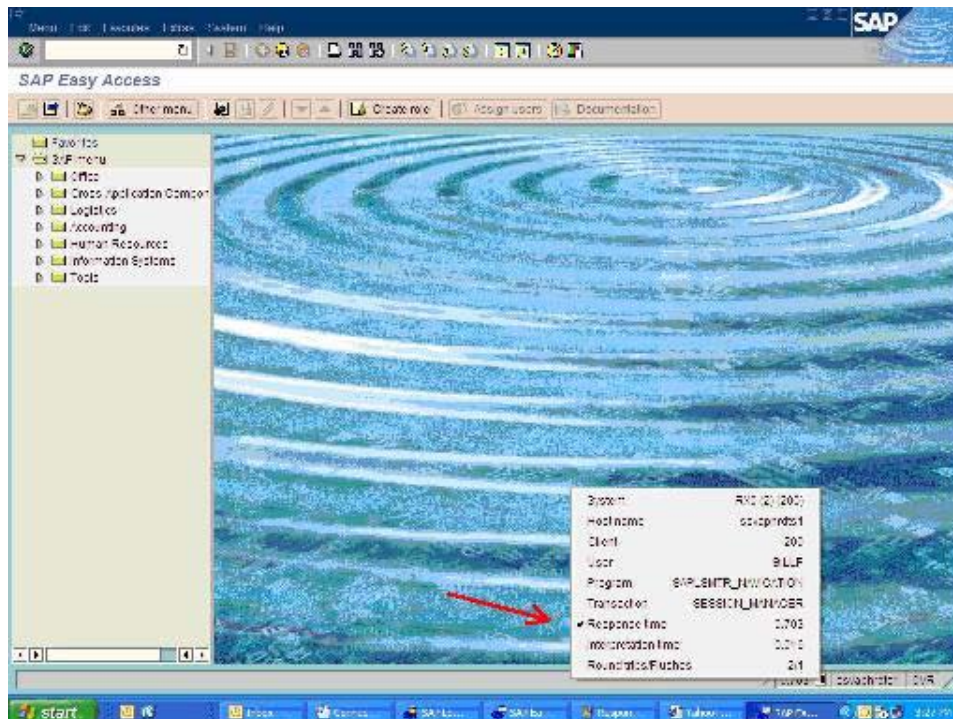

As the user changes screens within SAP GUI, the Response Time Monitor automatically updates to show the amount of frontend response time that was required for the transaction to take place.

## To open the Response Time Monitor in SAP GUI:

Click on the extended status icon in the lower right corner of the SAP GUI window.

---

When the Status Menu appears, click Response Time

The Response Time Monitor is now running. As you now navigate through SAP GUI, your Total Frontend Response Time for each transaction should be displayed in the bottom status bar. The time is represented in seconds.
